

Objective of lecture.

*To understand the following points*

1- Capital recovery.

2-EUAB,EUAC,EUAW.

Solved examples

## Capital Recovery and AW Value

استرداد رأس المال

- **Capital Recovery** is the equivalent annual cost of obtaining the asset plus the salvage
- CR is a function of  $\{P, SV, i\%, \text{ and } n\}$
- AW is comprised of two components: capital recovery for the initial investment  $P$  at a stated interest rate (MARR) and the equivalent annual amount  $A$

- An alternative usually has the following cash flow estimates:
  - **Initial Investment (P)** – the total first cost of all assets and services required to initiate the alternative.
  - **Salvage Value (SV)** – the terminal estimated value of assets at the end of their useful life.
  - **Annual Amount (A)** – the equivalent annual amount; typically this is the annual operating cost (AOC).

Two general monetary transactions are associated with the purchase and eventual retirement of a capital asset: its initial cost ( $I$ ) and its salvage value ( $S$ ). Taking into account these sums, we calculate the capital recovery factor as follows:

$$CR(i) = I(A/P, i, N) - S(A/F, i, N). \quad (6.2)$$

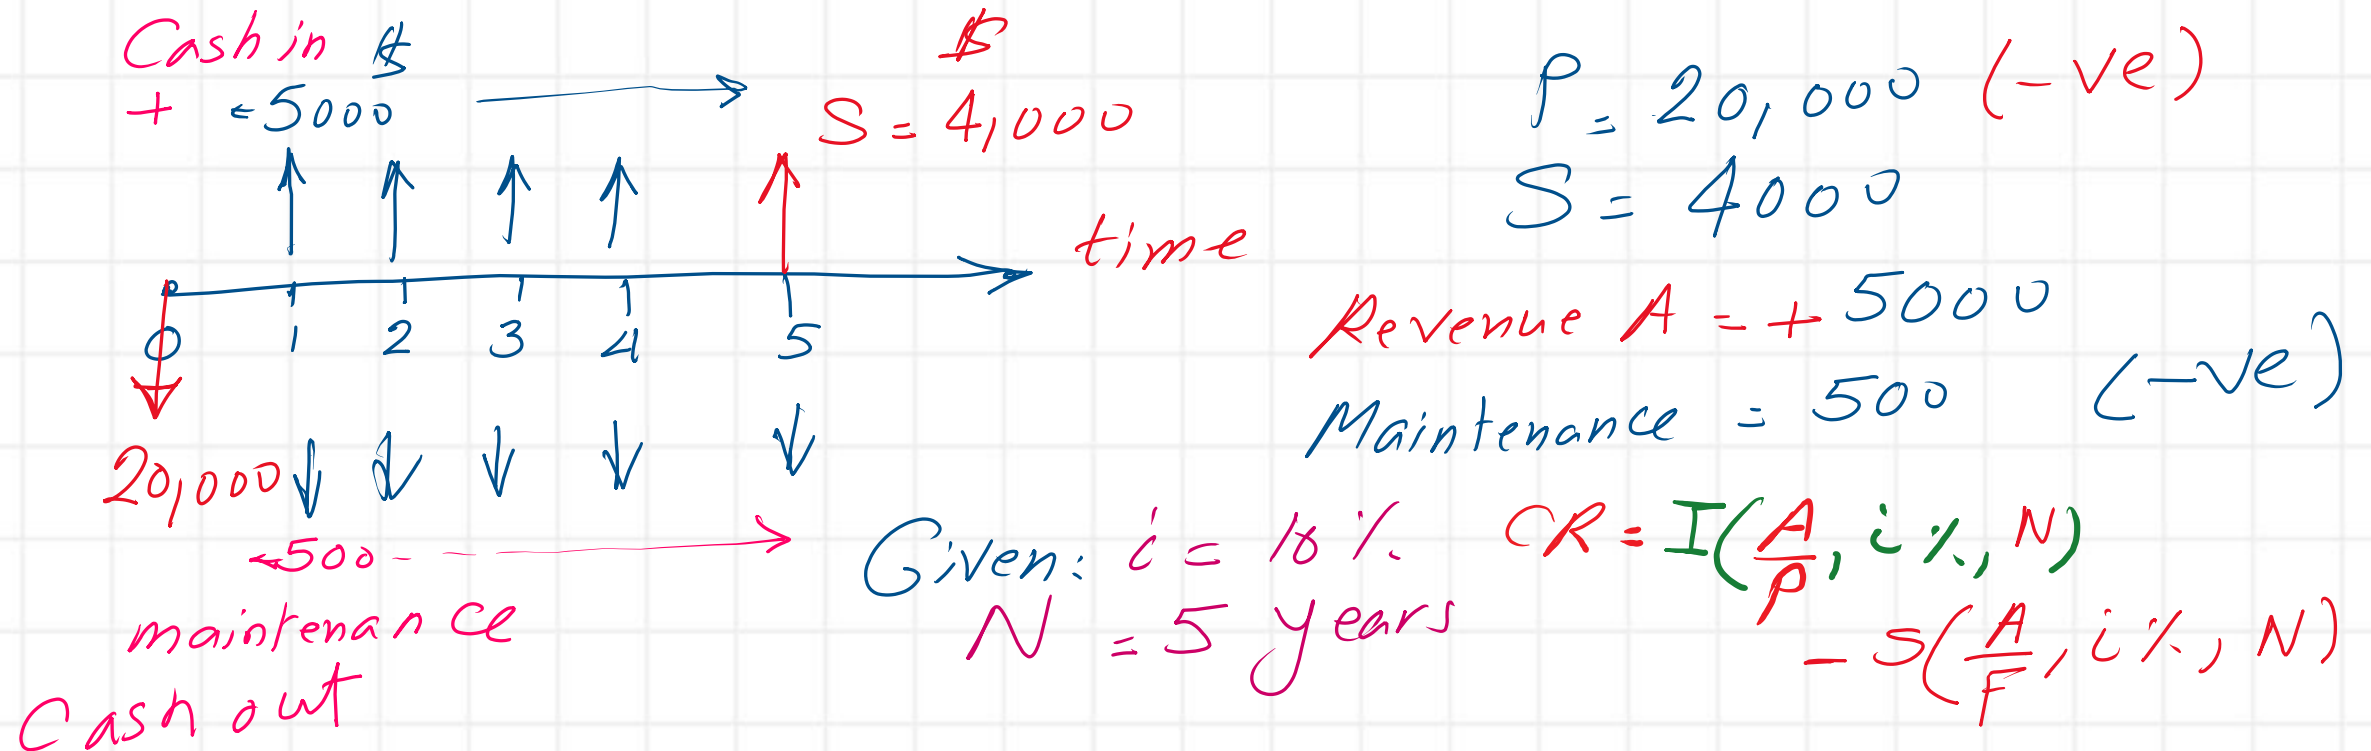

$$CR(i) = (I - S)(A/P, i, N) + iS$$

## Chan Park-chapter 6 Annual worth analysis

Consider a machine that costs \$20,000 and has a five-year useful life. At the end of the five years, it can be sold for \$4,000 after tax adjustment. The annual operating and maintenance (O&M) costs are about \$500. If the firm could earn an after-tax revenue of \$5,000 per year with this machine, should it be purchased at an interest rate of 10%? (All benefits and costs associated with the machine are accounted for in these figures.)

| 4 | 1.464  | .6830  | .2155   | .3155   | 4.641  | 3.170  | 1.381   | 4.378  | 4 |
| 5 | 1.611  | .6209  | .1638   | .2638   | 6.105  | 3.791  | 1.810   | 6.862  | 5 |

$A_3$ : operation cost = \$500

C/R and maintenance

$$ZA = 500 + 5276 - (655.2) = 5120.8 \quad \downarrow$$

$$A_2 = 4000(0.1638) = 655.2$$

The Second Formula  
Can be used to get  $CR(i)$

$$S = 4000$$

$$I = 20000$$

$$N = 5$$

$$i = 10\%$$

$$(CR(i) = (I - S)(A/P, i, N) + iS) \rightarrow$$

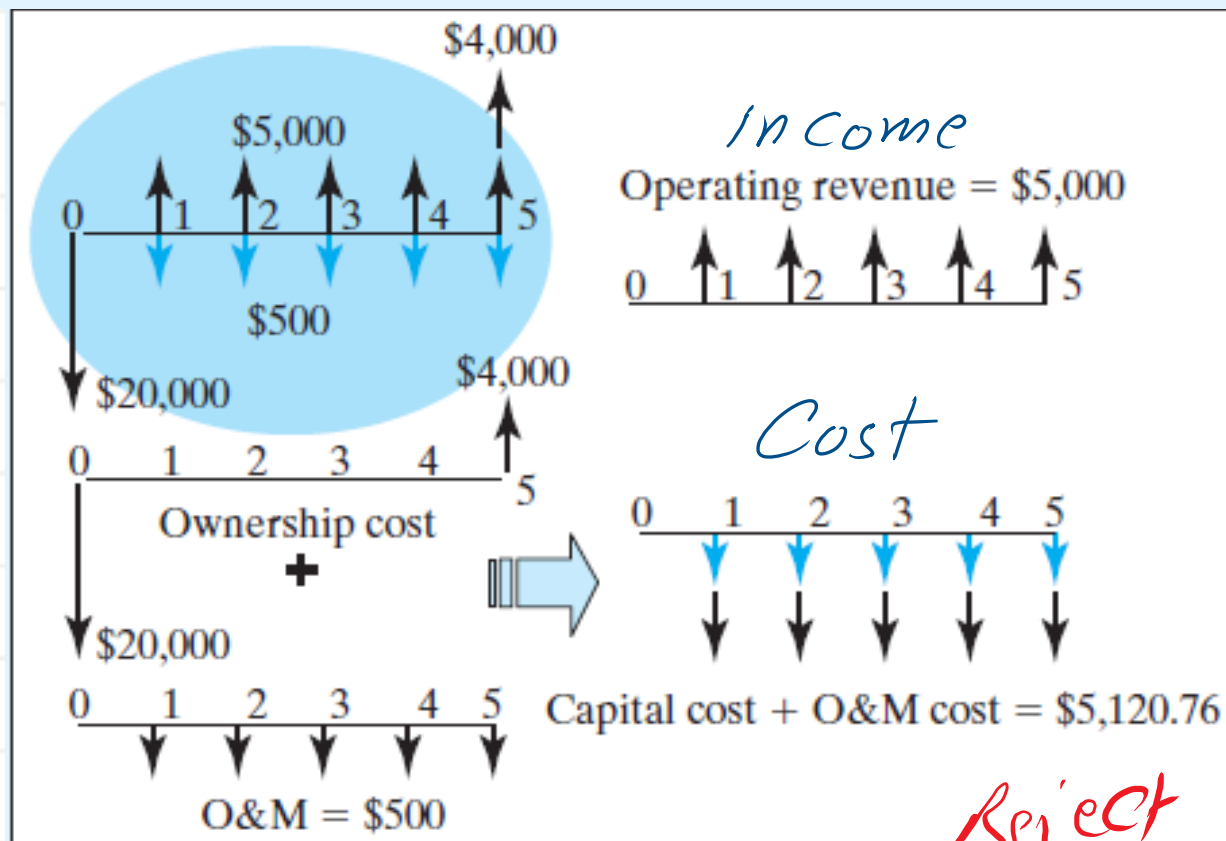

$$CR = (20,000 - 4,000) 0.2638 + (0.10)(4,000) = 4,620.8$$

$A_2$ : Maintenance cost  
= 500

$$CR(i) = 4,620.8 - 500 = 5,120.80$$

Consider a machine that costs \$20,000 and has a five-year useful life. At the end of the five years, it can be sold for \$4,000 after tax adjustment. The annual operating and maintenance (O&M) costs are about \$500. If the firm could earn an after-tax revenue of \$5,000 per year with this machine, should it be purchased at an interest rate of 10%? (All benefits and costs associated with the machine are accounted for in these figures.)

$$CR = I\left(\frac{A}{P}, i\%, n\right) - S\left(\frac{A}{F}, i\%, n\right)$$

$$i = 10\%$$

$$n = 5$$

$$\frac{A}{P} = 0.2638$$

$$\frac{A}{F} = 0.1638$$

$$CR = - (0.2638 (20,000)) + (0.1638 (4,000))$$

$$= -5276 + 655.2$$

$$= -4620.8$$

$$ADD \quad = -5120.8$$

$$O\&M \quad Rev < CR + Ma$$
