

- 3-34. A $\frac{3}{8} \times 5$ plate consisting of A36 steel with two longitudinal welds as shown in Fig. P3-34.

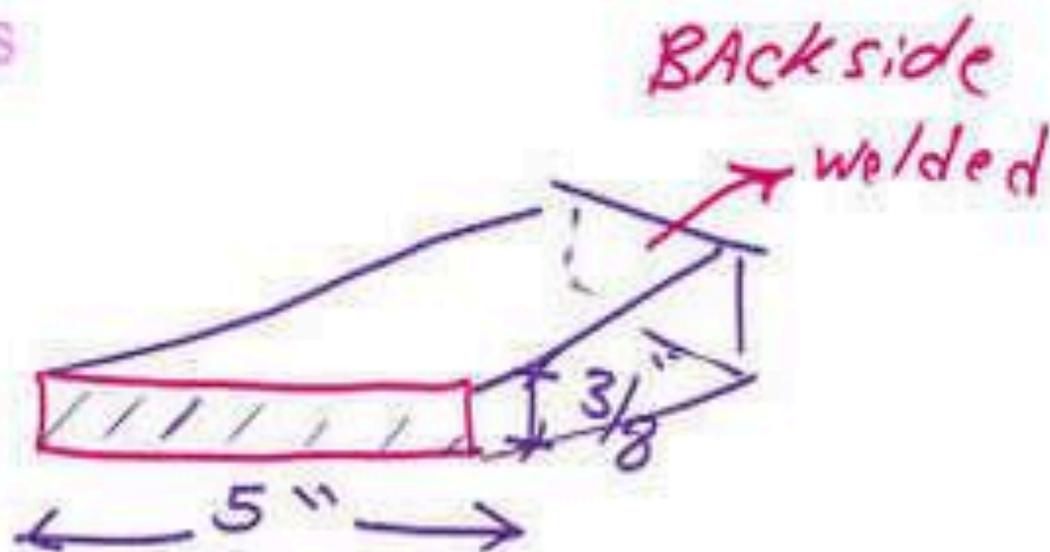

Determine the LRFD design strength and the ASD allowable strength for sections given -neglect block shear.

FIGURE P3-34

Case of Longitudinal welds

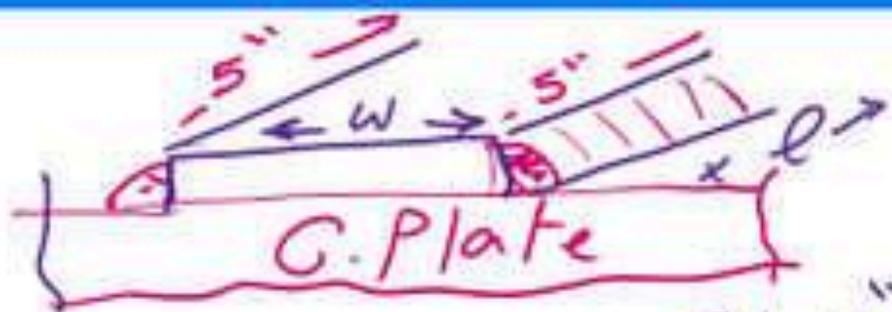

Solution:

A36 steel $\Rightarrow F_y: 36 \text{ ksi};$
 $F_u: 58 \text{ ksi};$

$$A_{\text{welded}} = 2\left(\frac{3}{8}\right)(5) = 3.75 \text{ inch}^2$$

CM# 14 - 2010 Specs

Case-4

PL $3\frac{1}{8} \times 5$

Case of Longitudinal weld

Weld Length = 5" For one side

$w = 5$

We have three cases

$l \geq 2w$ $l = 5$ $\frac{l}{w} = 1$

$U = 1.00$ $2w = 10$

$2w < l \geq 1.50w \rightarrow U = 0.87$

$1.5w > l \geq w \Rightarrow U = 0.75$

\Rightarrow third condition is applied

Case 4-2010

TABLE D3.1
Shear Lag Factors for Connections to Tension Members

Case	Description of Element	Shear Lag Factor, U	Example
1	All tension members where the tension load is transmitted directly to each of the cross-sectional elements by fasteners or welds (except as in Cases 4, 5 and 6).	$U = 1.0$	
2	All tension members, except plates and HSS, where the tension load is transmitted to some but not all of the cross-sectional elements by fasteners or longitudinal welds or by longitudinal welds in combination with transverse welds. (Alternatively, for W, M, S and HP, Case 7 may be used. For angles, Case 8 may be used.)	$U = 1 - \frac{\bar{x}}{l}$	
3	All tension members where the tension load is transmitted only by transverse welds to some but not all of the cross-sectional elements.	$U = 1.0$ and $A_n =$ area of the directly connected elements	
4	Plates where the tension load is transmitted by longitudinal welds only.	$l \geq 2w \dots U = 1.0$ $2w > l \geq 1.5w \dots U = 0.87$ $1.5w > l \geq w \dots U = 0.75$	

Prepared by Eng. Maged Kamel.

As a result of the preceding information, the AISC Specification (D2) states that the nominal strength of a tension member, P_n , is to be the smaller of the values obtained by substituting into the following two expressions:

For the limit state of yielding in the gross section (which is intended to prevent excessive elongation of the member),

$$P_n = F_y A_g \quad \leftarrow \text{Limit state of Yielding} \quad (\text{AISC Equation D2-1})$$

$$\phi_t P_n = \phi_t F_y A_g = \text{design tensile strength by LRFD } (\phi_t = 0.9)$$

$$\frac{P_n}{\Omega_t} = \frac{F_y A_g}{\Omega_t} = \text{allowable tensile strength for ASD } (\Omega_t = 1.67)$$

For tensile rupture in the net section, as where bolt or rivet holes are present,

$$P_n = F_u A_e \quad \leftarrow \text{Limit state of Rupture} \quad (\text{AISC Equation D2-2})$$

$$\phi_t P_n = \phi_t F_u A_e = \text{design tensile rupture strength for LRFD } (\phi_t = 0.75)$$

$$\frac{P_n}{\Omega_t} = \frac{F_u A_e}{\Omega_t} = \text{allowable tensile rupture strength for ASD } (\Omega_t = 2.00)$$

$$U = 0.75$$

Specs # 2010

$$A_g = 5 \left(\frac{3}{8} \right) = \frac{15}{8} = 1.875 \text{ inch}^2 = A_n$$

$$A_e = U \cdot A_n = 0.75(1.875) = 1.406 \text{ inch}^2$$

A36

$$F_y = 36 \text{ ksi}$$

$$F_u = 58 \text{ ksi}$$

Tensile strength

Tensile yielding

$$\phi = 0.90 \quad \text{yielding}$$

$$R = 1.67$$

LRFD Design

$$\phi P_n = 0.90(36)(1.875) = 60.75 \text{ kips} \quad \text{Tensile yielding}$$

Tensile strength (rupture) $\Rightarrow \phi = 0.75$ & $R = 2.0$

$$P_n = F_{ult} \cdot A_e = 58 \cdot (1.406) = 81.55 \text{ kips}$$

$$\phi P_n = 0.75(81.55) = 61.16 \text{ kips}$$

$$\phi P_n = \min(60.75, 61.16) = 60.75 \text{ kips} \Rightarrow 61 \text{ kips}$$

yielding
Controls

$$U = 0.75$$

Specs # 2010

$$A_g = 5 \left(\frac{3}{8} \right) = \frac{15}{8} = 1.875 \text{ inch}^2 = A_n$$

$$A_e = U \cdot A_n = 0.75(1.875) = 1.406 \text{ inch}^2$$

A36

$$F_y = 36 \text{ ksi}$$

$$F_u = 58 \text{ ksi}$$

Tensile strength

$$\phi = 0.90 \quad \text{yielding}$$

$$R = 1.67$$

ASD design strength-Yielding

$$\frac{1}{2} P_n = \frac{1}{2} A_g F_y = \frac{1}{1.67} (67.50) = 40.42 \text{ kips}$$

Tensile strength (rupture) \Rightarrow

ASD design strength-rupture

$$R = 2.0$$

$$P_n = F_{ult} \cdot A_e = 58 \cdot (1.406) = 81.55 \text{ kips}$$

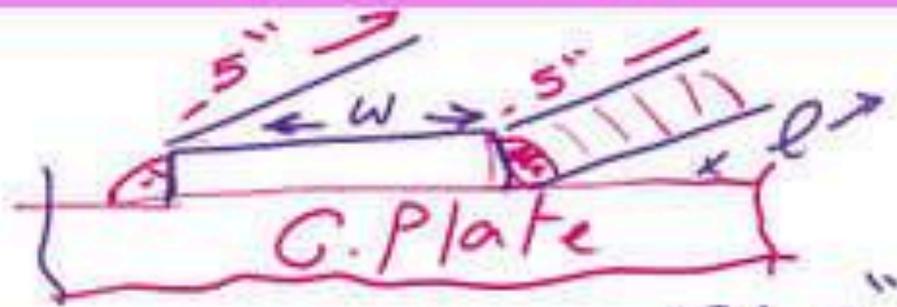

yielding
Controls

$$\frac{1}{2} P_n = \frac{1}{2} (81.55) = 40.775 \text{ kips} = 40.78 \text{ kips}$$

$$P_n = \min(40.42, 40.78) = 40.42 \text{ kips}$$

CM#15-2016 Specs

Case-4

PL 3/8 x

Case of Longitudinal weld
 Weld Length = 5" for one side
 W = 5"

$$U = \frac{3l^2}{3l^2 + w^2} \left(1 - \frac{\bar{x}}{L}\right) \Rightarrow \bar{x} = 0$$

Expression $\left(1 - \frac{\bar{x}}{L}\right) = 1$

$$U = \frac{3(5)^2}{3(5)^2 + (5)^2} (1) = \frac{75}{100} = 0.75$$

U value based on CM#15

Description of Element	Shear Lag Factor, U	Example
1. Tension members where the tension load is transmitted directly to each of the cross-sectional elements by fasteners or welds (except as in Cases 4, 5 and 6).	U = 1.0	-
2. All tension members, except HSS, where the tension load is transmitted to some but not all of the cross-sectional elements by fasteners or by longitudinal welds in combination with transverse welds. Alternatively, Case 7 is permitted for W, M, S and HP shapes. (For angles, Case 8 is permitted to be used.)	$U = 1 - \frac{\bar{x}}{l}$	
3. All tension members where the tension load is transmitted only by transverse welds to some but not all of the cross-sectional elements.	U = 1.0 and A _e = area of the directly connected elements	-
4. Plates, angles, channels with welds at heels, toes, and W-shapes with connected elements, where the tension load is transmitted by longitudinal welds only. See Case 2 for definition of \bar{x} . Item 4a	$U = \frac{3l^2}{3l^2 + w^2} \left(1 - \frac{\bar{x}}{l}\right)$
